Description

Task: AMS Integration in Java Utility

Objective:

Integrate AMS (Activity Management Service) logging into the Java utility project, replicating the functionality of the provided Node.js reference code. The integration should handle API request/response logging into a MongoDB-based AMS database, with configurable logging settings.

Details:

1. Reference Code (Node.js):

Location: <http://192.168.18.12/vishal.susar/marketplace-backend/-/tree/master/core/request>

Key Files: Explore all files in the core/request directory for request handling, wrapping, and AMS logging logic.

API Call Pattern: APIs are called using the axiosService.handle(conf, payload, clientId, applicationNumber, requestId) method, which acts as middleware to process requests/responses and log them in AMS.

AMS Client Instantiation: Refer to <http://192.168.18.12/vishal.susar/marketplace-backend/-/blob/master/core/odm/index.js> for how the AMS log client is instantiated.

2. Java Utility Repository:

Target Repo: <http://192.168.18.12/credit/common-utility/>

Task: Add AMS integration code to this Java utility project to mirror the Node.js implementation.

3. AMS Database Configuration:

Database: MongoDB

Connection Details:

json

```
"ams": {
  "host": "192.168.99.172",
  "port": "27017",
  "database": "db_ams",
  "user": "app_ams",
  "pass": "P4JYS7d9rrFH6G44",
  "authSource": "db_ams"
}
```

Logging Settings:

json

```
"ams": {
  "enabled": true,
  "skipLogging": false
}
```

Purpose: Allow enabling/disabling logging for specific APIs as needed.

4. AMS Logging Requirements:

Log Structure: Store API request/response details in AMS DB with the following sample document format:

json

```
{
  "_id": { "$oid": "68e8d44f90cfb4651c73ebeb" },
  "clientId": "30377",
  "eventType": "request-resp",
```

https://spicemoney.atlassian.net/si/jira.issueviews:issue-html/TEC-8400/TEC-8400.html

1/2

```
"result": {
  "REQUEST": {
    "dateTime": 1760089167545,
    "options": {
      "host": "credit-risk-uat.spicemoney.com",
      "port": "443",
      "path": "/api/preEligibility/milestone",
      "method": "POST",
      "headers": {
        "clientId": "30377",
        "applicationNumber": "NA",
        "requestId": "77574bed-aa35-44df-8cde-19d1076ff97c",
        "Authorization": "Token 12e316af96852c876dc71439470593aae0fd8043",
        "content-type": "application/json"
      },
      "timeout": 30000,
      "protocol": "https:"
    },
    "timestamp": "2025-10-13T18:35:51.545Z"
  }
}
```

- Mandatory Fields: clientId, requestId, and timestamp are required for searching logs in AMS.

5. Tasks to Implement in Java:

- Create a middleware-like component in Java to handle API requests/responses, similar to the Node.js axiosService.handle method.
- Implement MongoDB client integration to connect to the AMS database using the provided connection details.
- Ensure logging captures all request/response details, including headers, payload, status code, and duration, as shown in the sample document.
- Add configuration support to enable/disable logging (enabled and skipLogging flags).
- Ensure mandatory fields (clientId, requestId, timestamp) are included in every log entry.
- Test the integration to verify logs are stored correctly in the AMS MongoDB database.

6. Deliverables:

- Java code integrated into the common-utility repository.
- Documentation on how the AMS logging is implemented in Java, including configuration and usage instructions.
- Test cases to validate logging functionality for third-party API calls.

7. Notes:

- Refer to the Node.js codebase for guidance on request handling and logging logic.
- Ensure the Java implementation is modular and reusable across APIs.
- Validate AMS DB connectivity and log structure before deployment.

Assigned To: Kunal Aggarwal **Collaborator:** Diksha (to provide guidance or clarification on Node.js reference code)
